

ABSTRACT OF THE DISCLOSURE

A system and method for asynchronous storage and playback of system data provides asynchronously recording of a set of data as a dynamic snapshot at a predetermined time, and periodically recording, at a predetermined time interval, additional system commands which
5 represent changes to the set of data recorded at the predetermined time. The system and method also provide asynchronous playback associated with a time of interest by retrieving a dynamic snapshot associated with a time prior to the time of interest and also retrieving the additional system commands to move the retrieved dynamic snapshot forward in time to the time of
interest.
